

NEIGHBORHOOD GOLF CARTS

Technician Hiring Quiz (Written) · Version 1.0

40 questions · 120 points (3 each) · 45–60 minutes · Pass **90/120 (75%)** · Miss **2+** critical ★ safety questions = automatic fail. Golf cart brand experience not required. Circle one best answer.

Candidate: _____ Date: _____ Evaluator: _____ Score: ____ / 120 ★ missed: ____
/ 6 ■ Pass ■ Fail

Part A — Safety

1. ★ **You're about to work around a vehicle's big battery pack. What should you do first?**
 - A) Start removing cables so you can get to the problem faster
 - B) Make sure the vehicle won't move or power up, remove metal rings/watches, and think before you touch
 - C) Turn the radio on so you can hear if something sparks
 - D) Spray water on the batteries to cool them
2. ★ **The key is off. Does that mean the battery pack is safe to touch with metal tools?**
 - A) Yes — key off always kills all power
 - B) No — you still treat the pack as live until you've checked and made it safe
 - C) Yes, if the headlights are off
 - D) Only if the tires are chalked
3. ★ **Why do shops tell you to take off rings and metal watches before battery work?**
 - A) So the customer doesn't think you stole jewelry
 - B) Metal on your hand can short across battery posts and burn you
 - C) Jewelry confuses the battery charger
 - D) It is only a dress-code rule
4. ★ **You set a steel wrench across the positive and negative posts of a battery. What can happen?**
 - A) Nothing — batteries only shock through wires
 - B) A dangerous spark, melted tool, fire, or burn
 - C) The battery gets a helpful "boost"
 - D) The wrench calibrates itself
5. ★ **A safety switch or interlock is "getting in the way" of a quick test. What should you do?**
 - A) Bypass or defeat it so you can finish faster
 - B) Stop, find the right safe way to test, or ask the lead tech
 - C) Tape it down and hope for the best
 - D) Cut the wire and splice it later
6. ★ **You don't know if a cable is still connected to a live pack. Before you cut or strip it you should:**
 - A) Assume it's dead if the cart isn't moving
 - B) Verify with a meter (or your shop's safe process) that it's not live
 - C) Touch it lightly with a wet finger
 - D) Ask the customer to hold the other end
7. **When is it OK to wear safety glasses in the bay?**
 - A) Only when grinding
 - B) Anytime you're working — especially around batteries, wires, and spinning parts
 - C) Only if the owner is watching
 - D) Never — they fog up
8. **Lead-acid batteries on charge can make hydrogen gas. What's the main concern?**
 - A) The gas makes the tires go flat
 - B) In a closed space it can spark and explode / catch fire
 - C) It stains the paint blue
 - D) It only smells bad — no real risk --- ## Part B — Meter & basic electrical

Part B — Meter & basic electrical

9. **What is a multimeter mainly used for in this kind of work?**
 - A) Inflating tires to the right PSI
 - B) Measuring electrical things like voltage and checking if a path is open or closed
 - C) Programming the customer's phone

D) Weighing battery acid

10. You want to know how much electrical “pressure” is in a battery pack. Which reading is that?

- A) Amps only
- B) Voltage (volts)
- C) Tire pressure
- D) Horsepower

11. Continuity “beep” on a meter usually means:

- A) The wire can definitely carry full heavy current with no problem
- B) There is a complete path — the circuit isn't open — but it doesn't prove the cable is good under load
- C) The battery is fully charged
- D) The motor brushes are new

12. Two 12-volt batteries hooked up in series (end to end) should read about:

- A) 12 volts
- B) 6 volts
- C) 24 volts
- D) 0 volts

13. A connection is loose and dirty. Under load you often see:

- A) Voltage drop, heat, or a cart that dies when working hard
- B) Higher top speed
- C) Better radio reception
- D) Automatic tire inflation

14. Ohm's Law (useful idea) says voltage, current, and resistance are related. In plain terms, a bad high-resistance connection:

- A) Makes it easier for current to flow
- B) Fights current flow and wastes energy as heat
- C) Only affects paint color
- D) Charges the battery faster

15. You're measuring pack voltage. A safe habit is:

- A) Hold both metal probes in one bare fist across the posts
- B) Use the meter with proper leads, don't short the posts with the probes, and read the display
- C) Lick the probe to get a better reading
- D) Leave the meter on “amps” and jab both posts hard

16. If a fuse is blown, the smart next move is usually:

- A) Put in a much bigger fuse so it won't blow again
- B) Find why it blew, fix the cause, then replace with the correct size
- C) Bypass the fuse with foil
- D) Ignore it if the cart still moves a little --- ## Part C — Batteries & charging

Part C — Batteries & charging

17. A battery that shows OK voltage sitting still but dies when the vehicle works hard often means:

- A) The battery can't deliver current well (weak / high internal resistance)
- B) The tires must be square
- C) The horn is broken
- D) The paint is too dark

18. Flooded lead-acid batteries (with removable caps) may need water. You should:

- A) Fill them with tap water anytime, even when overflowing
- B) Follow shop rules — usually distilled water to the right level after charging guidance — never ignore acid safety
- C) Fill them with motor oil
- D) Never look at water level

19. Corroded, green/white crusty battery terminals usually need:

- A) To be ignored until the cart won't start at all
- B) Cleaning and a tight, correct reconnection (with safety gear)
- C) More perfume
- D) A larger fuse only

20. Mixing a charger meant for lead-acid with a lithium pack is:

- A) Fine if the sticker voltage looks similar

- B) Unsafe / wrong — charge profiles differ
- C) Required once a week
- D) Only a problem on gas carts

21. Lithium packs often have a BMS (battery brain). In plain terms it:

- A) Rotates the tires
- B) Protects the pack (and may shut power down if something's wrong)
- C) Replaces the brake shoes
- D) Only plays music

22. Before you blame the motor on a weak cart, a good early check is:

- A) Pack voltage and cable/connection condition
- B) Ordering a new motor online
- C) Painting the frame
- D) Replacing all lug nuts with gold ones

23. Batteries wired in parallel (same voltage, more capacity) vs series (voltage adds). If you need higher system voltage you generally use:

- A) Series
- B) Only parallel
- C) Neither — voltage is magic
- D) Air in the tires

24. A swollen, hot, or strongly smelling battery pack is:

- A) Normal on Fridays
- B) A stop-work warning — make it safe and get help / follow shop rules
- C) Fixed by hitting it with a hammer
- D) A good time to charge faster --- ## Part D — Figuring out problems (process)

Part D — Figuring out problems

25. Customer: “It won’t move at all.” You don’t know the brand. Best first move?

- A) Replace the controller immediately
- B) Confirm the complaint, make it safe, then check for power at the batteries / obvious disconnects
- C) Order a motor and hope
- D) Tell them to buy a new vehicle

26. Customer: “It runs a little, then dies on hills.” You’re trying to learn:

- A) Whether power stays up when the vehicle works hard, and whether connections are solid
- B) The customer’s favorite color
- C) Only the tire brand
- D) Whether the seat is vinyl or cloth

27. You’ve never seen this machine before. Best approach on day one?

- A) Guess and swap the most expensive part
- B) Use manuals / diagrams if available, test step by step, and ask the lead when stuck
- C) Bypass every safety switch “to learn faster”
- D) Work alone with the lights off

28. You measured pack voltage low at the controller but normal at the batteries. That suggests:

- A) A connection / cable / contactor problem between batteries and controller
- B) The sky is falling
- C) The tires need air only
- D) The horn relay

29. “Shotgunning” parts means:

- A) Careful testing before replacing anything
- B) Throwing parts at the problem without proving the fault
- C) Cleaning the shop with a shotgun
- D) Ordering lunch

30. A good write-up for the office so they can quote the customer includes:

- A) “Needs stuff”
- B) What you found, what you measured, and what should be fixed/replaced
- C) Only the invoice number in Roman numerals
- D) A joke, no facts

31. The cart worked after you wiggled a connector. Best next step?

- A) Close the job — “fixed itself”
- B) Find the bad connection/pin, repair it properly, and verify
- C) Replace the motor
- D) Ignore it until it strands the customer

32. When should you ask for help from the lead tech?

- A) Never — askers get fired
- B) When you're past a safe stop-point or the next step isn't clear
- C) Only after you've bypassed three safety switches
- D) Only on payday --- ## Part E — Mechanical & shop sense

Part E — Mechanical & shop sense

33. Before a test drive, a quick safety look should include:

- A) Only the cup holder
- B) Tires, brakes/pedal feel, steering play, anything that looks unsafe
- C) The customer's Facebook
- D) Paint shine only

34. A brake that drags (stays partly on) can make an electric cart seem:

- A) Faster than normal
- B) Weak, hot, or like it has a battery problem when the real issue is mechanical
- C) Louder on the radio
- D) Impossible to steer left only because of Wi-Fi

35. Soft or very low tires can cause:

- A) Harder rolling / poor performance and unsafe handling
- B) Higher battery voltage
- C) Automatic charging
- D) Better range always

36. You removed four bolts to take a cover off. Best habit?

- A) Leave them on the floor for the broom
- B) Keep hardware organized and put the cover back securely when done
- C) Throw extras away so the next person has fewer
- D) Replace them with zip ties only

37. A wheel feels loose (lug nuts not tight). You should:

- A) Test drive at top speed to “seat” them
- B) Stop — tighten to the proper pattern/spec or flag it before driving
- C) Add grease to the tire tread
- D) Ignore if the hubcap looks fine --- ## Part F — Light lithium & shop reality (still entry-level)

Part F — Light lithium & shop reality

38. Biggest plain-language difference: flooded lead-acid vs lithium on a cart?

- A) Lithium packs often need a matching charger and have a BMS; you don't water lithium cells like flooded lead-acid
- B) Lithium carts don't need brakes
- C) Lead-acid never needs a charger
- D) They are identical in every way

39. If a lithium cart suddenly won't go and the monitor shows a fault or zero percent after a hard run, a sensible thought is:

- A) Smash the pack
- B) The pack protection may have shut things down — don't jump to replacing the motor first
- C) Immediately install a lead-acid charger
- D) Remove all fuses permanently

40. You find a problem that will take parts and more time than the customer expected. What should you do?

- A) Stay quiet and hope nobody notices until Friday
- B) Tell the lead tech / office clearly what's wrong and what's needed before the customer is surprised
- C) Order the most expensive part without asking
- D) Send the cart home broken with no explanation --- **End of quiz.** Hand in to evaluator. Do not write on the answer key.
